Sayı : E-34221550-611.99-620 **Tarih**: 17.01.2024
Konu : Kritik hammaddeler tüzüğü ve SKDM geçiş dönemi varsayılan değerleri hk.

TÜM ODA VE BORSALARA
(Genel Sekreterlik)

Ticaret Bakanlığı tarafından Birliğimize iletilen yazılarda; Kritik Hammaddeler Tüzüğü ve SKDM Geçiş Dönemi Varsayılan Değerleri hakkında bilgi verilmektedir.

Kritik Hammaddeler Yasa taslağında, anılan hammaddelerin AB'nin yıllık tüketiminin en az %10'una karşılık gelen kısmının AB'de üretilmesi, en az %40'ının AB'de işlenmesi ve en az %25'inin ise geri dönüşümden elde edilmesi, her bir stratejik hammaddenin tüketiminin %65'inden fazlasının tek bir üçüncü ülkeden tedarik edilmemesi hedeflenmektedir.

Sınırda Karbon Düzenleme Mekanizması (SKDM) kapsamında ise, 1 Ekim 2023 ile 31 Aralık 2025 tarihleri arasını kapsayan geçiş dönemi boyunca ithal ürünlerde gömülü emisyonların belirlenmesi amacıyla kullanılabilecek varsayılan değerlere ilişkin rehber yayınlandığı bildirilmektedir.

Ticaret Bakanlığının Birliğimize ilettiği söz konusu yazılar ve ekleri, ekte sunulmakta olup; üyelerinize duyurulmasını rica ederim.

DAĞITIM YERLERİNE

AB Komisyonu Başkan Yardımcısı Maroş Şefçoviç ile İç Pazar Komiseri Thierry Breton'un daveti üzerine, stratejik hammadde projelerine ilişkin yüksek düzeyli bir yuvarlak masa toplantısı yirmi stratejik hammadde projesinin temsilcilerinin katılımıyla 8 Aralık 2023 tarihinde Brüksel'de düzenlenmiştir. Konuya dair AB Komisyonunca yapılan açıklamada öne çıkan hususlar aşağıda sunulmaktadır:

- Hammaddelere ve bataryalara dair Avrupa'daki ittifakların yardımıyla seçilen projeler, Avrupa'da ve AB'nin hammaddeler konusunda stratejik ortaklıklar kurduğu ülkelerdeki üretim, işleme ve geri dönüşüm potansiyelini temsil etmektedir. Söz konusu projelerin AB'nin Kritik Hammaddeler Yasasıyla altı çizilen hedeflerine ulaşma çabalarında önemli bir rol oynaması beklenmektedir.

- Toplantıda temsil edilen hammadde sektörleri arasında lityum (Almanya, Çekya, İspanya, Finlandiya) ve kritik nadir toprak elementleri (Estonya, Polonya) ile geri dönüşüm sektörleri (Fransa, İtalya, İsveç, Romanya) yer almıştır. Ayrıca, ortak konumundaki ülkeler Grönland'da bir molibden madenciliği projesi; Norveç'te bir doğal grafit projesi; Kazakistan'dat ungsten sahaları; Kanada'da bir nadir toprak elementi üretim ve işleme projesive Arjantin'de bir lityum tuzlu su çıkarma ve işleme projesi üzerinde çalışacaklardır.Komisyon tarafından seçilen tüm projelerin 2030'dan önce başlaması beklenmektedir.

- Kritik Hammaddeler Yasası yürürlüğe girdiğinde, 2024 yılında başlatılması beklenen "Stratejik Projeler" için ilk başvuru çağrısı için anılan projelerin ve diğer proje temsilcilerinin gerekli hazırlıkları yapması beklenmektedir.

AB Komisyonu Başkanı Ursula von der Leyen tarafından 2022'de duyurulan ve Komisyon tarafından Mart 2023'de sunulan Kritik Hammaddeler Yasası taslağı üzerinde Komisyon, AB Konseyi ve Avrupa Parlamentosu (AP) arasında devam eden üçlü müzakerelerde 13 Kasım 2023 tarihinde siyasi uzlaşı sağlanmıştı.

Bahse konu siyasi uzlaşı 12 Aralık günü AP'de onaylanmış olup, halihazırda uzlaşının Konsey tarafından resmi olarak onaylanması ve onaylanan metnin AB Resmi Gazetesinde yayımını takip eden yirminci günde yürürlüğe girmesi beklenmektedir.

Yasada, hammaddeler kritik ve stratejik olarak sınıflandırılmaktadır. Yasa çerçevesinde, stratejik hammaddeler listesinin, yeşil ve dijital dönüşümü destekleyen stratejik teknolojilerde veya savunma veya uzay uygulamalarında kullanımları dikkate alınarak yüksek stratejik öneme sahip olan ve küresel arz ile öngörülen arz arasında dengesizlik bulunması söz konusu olan hammaddeleri içermesi öngörülmektedir. Öte yandan, kritik hammaddeler listesinin ise, tüm stratejik hammaddelerin yanı sıra AB ekonomisinin geneli için yüksek öneme sahip olan ve tedarik kesintisi riskinin yüksek olduğu diğer hammaddeleri de içermesi öngörülmektedir.

Kritik Hammaddeler Yasa taslağında, anılan hammaddelerin AB'nin yıllık tüketiminin en az %10'una karşılık gelen kısmının AB'de üretilmesi, en az %40'ının AB'de işlenmesi ve en az %25'inin ise geri dönüşümden elde edilmesi, her bir stratejik hammaddenin tüketiminin %65'inden fazlasının tek bir üçüncü ülkeden tedarik edilmemesi hedeflenmektedir.

Bilgilerini rica ederim.

Taxation and Customs Union

NEWS ARTICLE | 22 December 2023 | Directorate-General for Taxation and Customs Union

Commission publishes default values for determining embedded emissions during the CBAM transitional period and updated guidance on reporting obligations

On 22 December 2023, the Commission published the default values that can be used to determine embedded emissions in imported goods (except electricity) covered by Carbon Border Adjustment Mechanism (CBAM) during its transitional period which lasts until the end of 2025.

Default values play a specific role in CBAM implementation during the transitional period, in particular when importers do not have all the necessary information:

1. During the three first quarterly reports (Q4 of 2023 and Q1&2 of 2024), declarants may report embedded emission based on default values made available and published by the European Commission without quantitative limit;
2. From Q3 of 2024 and until the end of 2025, declarants can still report emissions based on estimations but only for complex goods and with a limit of 20% of the total embedded emissions. Using default values would qualify as ‘estimation’.

These default values will be revised regularly after the end of the first reporting period for Q4 of 2023 (to be submitted by 31 January 2024), to take into account data collected in that first reporting period as well as feedback from EU industry and from non-EU producers of CBAM goods.

Besides the flexibilities foreseen in the CBAM regulation and in its implementing regulation for the transitional period, additional simplifications or facilities have been integrated or will be integrated soon in the online dedicated reporting tool, the CBAM transitional registry. These include:

- An option for recording emission data of a specific good to be reused in subsequent reports (feasible from the second quarterly report in April 2024);
- An option for reconducting the previous report updating the imported quantities;
- An option for reporting data based on an XML file to allow reporting declarants to automatise their own process to reuse previous reports data whenever appropriate;
- Clarification that for operators, the default reporting period is twelve months to allow them to collect representative data that reflects an installation’s annual operations. The twelve-month reporting period may be either a calendar year or alternatively a fiscal year. However, operators may also choose an alternative reporting period of a least three months if the installation participates in an eligible MRV system and the reporting period coincides with the requirements of that MRV system.

The Commission will continue working on further simplifying reporting obligations and how to facilitate the submission of certain business data directly from the non-EU producers to the CBAM Registry before the second reporting period in 2024. The European Commission has also updated two written guidance documents to help importers and installation operators outside the EU to navigate the transitional period (1 October 2023 – 31 December 2025) with the reporting obligations.

The guidance documents are updated with clarifications and corrections especially for the timeline for the reporting periods, and quality of information in the CBAM reports e.g. information to be submitted for inward processing and production routes. The guidance documents are accompanied by an electronic template for information that may be used by installation operators to communicate information on the embedded emissions of their goods to the reporting declarants.

Background

CBAM is the EU's landmark tool to fight carbon leakage and one of the central pillars of the EU's ambitious Fit for 55 Agenda. CBAM has two goals: to contribute to the EU achieving its ambitious climate policies and to encourage industry worldwide to embrace greener technologies, particularly in countries with less ambitious green standards.

In its transitional phase, CBAM will only apply to imports of cement, iron and steel, aluminium, fertilisers, electricity and hydrogen. EU importers of those goods will have to report on the volume of their imports and the greenhouse gas (GHG) emissions embedded during their production, but without paying any financial adjustment at this stage.

The objective of the transitional period is to serve as a pilot and learning period for all stakeholders (importers, producers and authorities) and to collect useful information on embedded emissions to refine the methodology for the definitive period. In a report in mid-2025, the Commission will draw the lessons of the transitional period from that information to refine the mechanism’s scope and the methodologies for calculating embedded emissions before CBAM payments begin in 2026.

While importers are asked to collect data as of the fourth quarter of 2023, their first report will only have to be submitted by 31 January 2024 at the latest. These reports can be amended until 31 July 2024.

The Implementing Regulation on reporting requirements and methodology provides for some flexibility when it comes to the values used to calculate embedded emissions on imports during the transitional phase.

Until the end of 2024, companies will have the choice of reporting in three ways:

- full reporting according to the new methodology (EU method);
- reporting based on an equivalent method (three options) and
- reporting based on default reference values (only until July 2024, i.e for Q4 of 2023 and Q1&Q2 of 2024)

As of 1 January 2025, only the EU method will be accepted.

Default values for the transitional period of the CBAM between 1 October 2023 and 31 December 2025 *(https://taxation-customs.ec.europa.eu/system/files/2023-12/Default%20values%20transitional%20period.pdf)*

Brussels, 22 December 2023

DEFAULT VALUES FOR THE TRANSITIONAL PERIOD OF THE CBAM BETWEEN 1 OCTOBER 2023 AND 31 DECEMBER 2025

CONTENTS

1 INTRODUCTION

The Carbon Border Adjustment Mechanism (CBAM) is an environmental policy instrument designed to support the EU climate ambitions of achieving a net reduction of greenhouse gas (GHG) emissions of at least 55% by 2030 and of reaching climate neutrality by 2050 at the latest. The CBAM will apply the same carbon price to imported goods as would be paid by installations operating in the European Union (EU). In doing so, the CBAM reduces the risk of the EU's climate objectives being undermined by production relocating to countries with less ambitious decarbonisation policies (so-called 'carbon leakage') and introduces a strong signal to producers in third countries to decarbonise.

The CBAM does not target countries, but the embedded greenhouse gas emissions of goods imported into the EU for a number of specific sectors that are within the scope of the EU Emissions Trading System (EU ETS) and that are at high risk of carbon leakage. These are: iron and steel, cement, fertilisers, aluminium, hydrogen and electricity. It also includes some precursors and some downstream products of the aforementioned sectors (hereinafter referred to as "CBAM goods").

CBAM will be introduced gradually. The transitional period from 1 October 2023 to 31 December 2025 is important to allow for a careful, predictable and proportionate transition for EU and non-EU businesses, as well as for public authorities. During this period, importers of CBAM goods will only have to report greenhouse gas emissions (GHG) embedded in their imports emissions embedded in their imported goods(direct and indirect emissions), without paying any financial payments or adjustments.[1] The monitoring and reporting rules for the transitional CBAM period are laid out in Implementing Regulation (EU) 2023/1773.[2] Verification of those emissions by an external third party will be purely voluntary.

The Implementing Regulation on reporting requirements and methodology provides for flexibility when it comes to the values used to calculate embedded emissions on imports during the transitional phase.

Until the end of 2024, companies will have the choice of reporting in three ways:

(a) full reporting according to the new methodology (EU method);

(b) reporting based on an equivalent method (three options) and

(c) reporting based on default reference values (only until July 2024, i.e for Q4 of 2023 and Q1&Q2 of 2024)

(1) Regulation (EU) 2023/956 of the European Parliament and of the Council of 10 May 2023 establishing a carbon border adjustment mechanism. OJ L 130, 16.5.2023, p. 52–104. Available from: http://data.europa.eu/eli/reg/2023/956/oj.

(2) Commission Implementing Regulation (EU) 2023/1773 of 17 August 2023 laying down the rules for the application of Regulation (EU) 2023/956 of the European Parliament and of the Council as regards reporting obligations for the purposes of the carbon border adjustment mechanism during the transitional period. OJ L228, 15.9.2023, p. 94–195. Available from: https://eur-lex.europa.eu/eli/reg/2023/1773/oj.

As of 1 January 2025, the implementing regulation provides that only the EU method will be accepted. The Commission will assess this in view of the experience during the first 4 reporting periods.

In order to help declarants with their reporting obligations, additional simplifications or facilities have been integrated (or will be integrated soon) in the online dedicated reporting tool, the CBAM transitional registry. Some of them are the following:

- Option for recording emission data of a specific good to be reused in subsequent reports (feasible from the second quarterly report in April 2024)
- Option for reconducting the previous report updating the imported quantities
- Option for reporting data based on an XML file to allow reporting declarants automatise their own process to reuse previous reports data whenever appropriate
- Clarification that for operators, the default reporting period is twelve months to allow them to collect representative data that reflects an installation's annual operations. The twelve-month reporting period may be either a calendar year or alternatively a fiscal year. However, operators may also choose an alternative reporting period, of a least three months, if the installation participates in an eligible MRV system and the reporting period coincides with the requirements of that MRV system.

Access to the CBAM transitional registry should be requested through the National Competent Authority (NCA) of the Member State in which the importer is established.

Default values play a specific role in CBAM implementation during the transitional period as presented in the next sections:

- Section 2 of this document outlines the use of default values for CBAM goods other than electricity
- Section 3 of this document outlines the use of default values for determining indirect emissions embedded in CBAM goods other than electricity
- Section 4 of this document outlines the use of default values for electricity as CBAM good

The European Commission has also issued two written guidance documents to help importers and installation operators outside the EU to navigate the transitional period (1 October 2023 – 31 December 2025) with the reporting obligations. These guidance documents are updated regularly.

2 DEFAULT VALUES FOR CBAM GOODS OTHER THAN ELECTRICITY IN THE TRANSITIONAL CBAM PERIOD

2.1 General

Whilst the general approach for imported CBAM goods other than electricity is that declarants will have to report based on actual embedded emissions according to the monitoring methodology that is laid out in Implementing Regulation (EU) 2023/1773 (with the flexibilities mentioned above), Default values do play a specific role in CBAM implementation during the transitional period in particular if importers do not have all the necessary information:

i. During the three first quarterly reports (Q4 of 2023 and Q1&2 of 2024), declarants may report embedded emission based on default values made available and published by the European Commission without quantitative limit

ii. From Q3 of 2024 and until the end of 2025, declarants can still report emissions based on estimations but only for complex goods and with a limit of 20% of the total embedded emissions. Using default values would qualify as 'estimation'.

This section of the document provides the default values for CBAM goods other than electricity that may be used for reporting embedded emissions during the transitional CBAM period until 31 December 2025, under the conditions listed above. Declarants should use them when they do not have or are not able to report actual emissions. These default values will be regularly revised, from the first reporting quarter, to take into account the data collected in that first reporting period as well as feedback from both the EU industry and from non-EU producers of CBAM goods.

The values in this section represent a 'world' average, weighted by production volumes. They are based on estimations on embedded emissions in CBAM goods (i.e. iron and steel, cement, fertilisers and aluminium) as carried out by the Commission's Joint Research Centre (JRC). The emission intensities were estimated for different countries through a transparent methodology on the basis of publicly available data. The JRC study[3] focused on the EU's main trading partners, covering around 15 to 20 countries for each sector in the CBAM scope. The default values for hydrogen are based on a separate JRC report[4], published in November 2023.

The default values in this section apply independently of the country of origin of the CBAM goods and only until the end of the transitional period on 31 December 2025. From 2026 onwards, another set of default values will apply. Those values will be set at the average emission intensity of each exporting country, increased by a proportionately designed mark-up. Those default values will be determined through an implementing act planned for adoption in 2025.

([3]) Vidovic, D., Marmier, A., Zore, L. and Moya, J., *Greenhouse gas emission intensities of the steel, fertilisers, aluminium and cement industries in the EU and its main trading* partners, Publications Office of the European Union, Luxembourg, 2023, doi: 10.2760/359533, JRC134682. Available from: https://publications.jrc.ec.europa.eu/repository/handle/JRC134682.

([4]) Dolci, F. and Arrigoni, A., *Estimation of the global average GHG emission intensity of hydrogen production*, Publications Office of the European Union, Luxembourg, 2023, doi:10.2760/744837, JRC135067. Available from: https://publications.jrc.ec.europa.eu/repository/handle/JRC135067.

The sector tables below give default values at the 4, 6 and 8-digit CN code level[5] for use in the transitional CBAM period.

- Default values given at a 4-digit CN code level apply to all goods falling within this 4-digit CN code category.
- Default values supplied at a 6-digit CN code level apply to all goods falling within this 6-digit CN code category.
- Default values supplied at an 8-digit CN code level only apply to the specific goods listed under the 8-digit CN code.

Default values are given in tonnes of CO_2e emissions per tonne of goods. If a row in the table contains several CN codes, but only one set of default values (i.e. one direct, one indirect and one total), those default values apply to all CN codes in that row.

([5]) Commission Implementing Regulation (EU) 2020/1577 of 21 September 2020 amending Annex I to Council Regulation (EEC) No 2658/87 on the tariff and statistical nomenclature and on the Common Customs Tariff. 2.2 Default values for the transitional period for iron and steel

Aggregated goods category	CN code	Description	Default values (tonne CO_2e/tonne goods)		
			Direct emissions	Indirect emissions	Total emissions
Sintered Ore	2601 12 00	Agglomerated iron ores and concentrates, other than roasted iron pyrites	0,31	0,05	0,36
Pig iron	7201	Pig iron and spiegeleisen in pigs, blocks or other primary forms	1,90	0,17	2,07
FeMn	7202 1	Ferro-manganese	1,44	2,08	3,51
FeCr	7202 4	Ferro-chromium	2,07[6]	3,38	5,45
FeNi	7202 6	Ferro-nickel	3,48[6]	2,81	6,26
DRI	7203	Ferrous products obtained by direct reduction of iron ore and other spongy ferrous products	4,81	0,00	4,81
Crude steel	7206	Iron and non-alloy steel in ingots or other primary forms (excluding iron of heading 7203)	See below		
	7206 10 00	Ingots	2,52	0,23	2,75
	7206 90 00	Other	1,97	0,23	2,20
	7207	Semi-finished products of iron or non-alloy steel	See below		
	7207 11 11	Of free-cutting steel	1,89	0,32	2,21
	7207 11 14	Of a thickness not exceeding 130 mm			
	7207 11 16	Of a thickness exceeding 130 mm			
	7207 12 10	Rolled or obtained by continuous casting			
	7207 19 12	Rolled or obtained by continuous casting			
	7207 19 80	Other			
	7207 20 11	Of free-cutting steel			
	7207 20 15	0,25 % or more but less than 0,6 % of carbon			
	7207 20 17	0,6 % or more of carbon			
	7207 20 32	Rolled or obtained by continuous casting			
	7207 20 52	Rolled or obtained by continuous casting			
	7207 20 80	Other			
	7207 11 90 7207 12 90 7207 19 19 7207 20 19 7207 20 39 7207 20 59	Forged	2,65	0,62	3,27

[6] The value is based on the constant GHG emission intensity value given for individual countries in the JRC study[3]. This corrects a small inconsistency detected for the weights that were applied for calculating the weighted average values in that report.

Aggregated goods category	CN code	Description	Default values (tonne CO_2e/tonne goods)		
			Direct emissions	Indirect emissions	Total emissions
	7218	Stainless steel in ingots or other primary forms; semi-finished products of stainless steel		See below	
	7218 10 00	Ingots and other primary forms	2,51	2,10	4,61
	7218 99 19 7218 99 80	Forged			
	7218 91	Of rectangular (other than square) cross-section	2,18	1,90	4,08
	7218 99 11	Rolled or obtained by continuous casting			
	7218 99 20	Rolled or obtained by continuous casting			
	7224	Other alloy steel in ingots or other primary forms; semi-finished products of other alloy steel		See below	
	7224 10	Ingots and other primary forms	2,41	0,79	3,20
	7224 90 18 7224 90 90	Forged			
	7224 90 02	Of tool steel	1,95	0,40	2,35
	7224 90 03	Of high-speed steel			
	7224 90 05	Containing by weight not more than 0,7 % of carbon, 0,5 % or more but not more than 1,2 % of manganese and 0,6 % or more but not more than 2,3 % of silicon; containing by weight 0,0008 % or more of boron with any other element less than the minimum content			
	7224 90 07 7224 90 14	Other			
	7224 90 31	Containing by weight not less than 0,9 % but not more than 1,15 % of carbon, not less than 0,5 % but not more than 2 % of chromium and, if present, not more than 0,5 % of molybdenum			
	7224 90 38	Other			
Iron or steel products	7205	Granules and powders, of pig iron, spiegeleisen, iron or steel (if not covered under category pig iron)	1,90	0,17	2,07
	7208	Flat-rolled products of iron or non-alloy steel, of a width of	2,01	0,27	2,28

Aggregated goods category	CN code	Description	Default values (tonne CO_2e/tonne goods)		
			Direct emissions	Indirect emissions	Total emissions
		600 mm or more, hot-rolled, not clad, plated or coated			
	7209	Flat-rolled products of iron or non-alloy steel, of a width of 600 mm or more, cold-rolled (cold-reduced), not clad, plated or coated	2,03	0,36	2,39
	7210	Flat-rolled products of iron or non-alloy steel, of a width of 600 mm or more, clad, plated or coated	1,97	0,39	2,35
	7211	Flat-rolled products of iron or non-alloy steel, of a width of less than 600 mm, not clad, plated or coated	See below		
	7211 13 00	Rolled on four faces or in a closed box pass, of a width exceeding 150 mm and a thickness of not less than 4 mm, not in coils and without patterns in relief	2,01	0,27	2,28
	7211 14 00	Other, of a thickness of 4,75 mm or more			
	7211 19 00	Other			
	7211 23	Containing by weight less than 0,25 % of carbon	2,03	0,36	2,39

2.3 Default values for the transitional period for cement

Aggregated goods category	CN code	Description	Default values (tonne CO_2e/tonne goods)		
			Direct emissions	Indirect emissions	Total emissions
Calcined clay	2507 00 80	Other kaolinic clays[7] *(nb: applicable for calcined clay only)*	0,23	0,08	0,32
Cement clinker	2523 10 00	Cement clinkers[8]	0,83	0,04	0,87
Cement	2523 21 00	White Portland cement, whether or not artificially coloured	1,16	0,10	1,26
	2523 29 00	Other Portland cement[9]	0,81	0,06	0,87
	2523 90 00	Other hydraulic cements[10]	0,59	0,04	0,63
Aluminous cement	2523 30 00	Aluminous cement[11]	1,75	0,15	1,90

Source: JRC, 2023.[3]

([7]) In the case of 'non-calcined clay' zero emissions may be indicated with clarification in the comments section of the report

([8]) The default values are based on the JRC estimates for grey cement clinkers.

([9]) The default values are based on the JRC estimates for grey Portland cement.

([10]) The default values are based on the JRC estimates for other grey hydraulic cements.

([11]) Also referred to as 'calcium aluminate cement'.

2.4 Default values for the transitional period for fertilisers

Aggregated goods category	CN code	Description	Default values (tonne CO_2e/tonne goods)		
			Direct emissions	Indirect emissions	Total emissions
Nitric acid	2808 00 00	Nitric acid; sulphonitric acids	2,56	0,05	2,60
Ammonia	2814	Ammonia, anhydrous or in aqueous solution	2,68	0,14	2,82
Mixed fertilisers	2834 21 00	Nitrates of potassium	1,82	0,06	1,88
	3102	Mineral or chemical fertilisers, nitrogenous	See below		
	3102 10	Urea, whether or not in aqueous solution	1,78	0,12	1,9
	3102 21 00	Ammonium sulphate	0,86	0,09	0,94
	3102 29 00	Double salts and mixtures of ammonium sulphate and ammonium nitrate	1,54	0,10	1,63
	3102 30	Ammonium nitrate, whether or not in aqueous solution	2,32	0,07	2,39
	3102 40	Mixtures of ammonium nitrate with calcium carbonate or other inorganic non-fertilising substances	1,77	0,06	1,84
	3102 50 00	Sodium nitrate	3,99	0,07	4,06
	3102 60 00	Double salts and mixtures of calcium nitrate and ammonium nitrate	1,87	0,08	1,95
	3102 80 00	Mixtures of urea and ammonium nitrate in aqueous or ammoniacal solution	1,28	0,06	1,34
	3102 90 00	Other including mixtures not specified in the foregoing subheadings[12]	1,65	0,10	1,74
	3105	Mineral or chemical fertilisers containing two or three of the fertilising elements nitrogen, phosphorus and potassium	See below		
	3105 10 00	Goods of this chapter in tablets or similar forms or in packages of a gross weight not exceeding 10 kg[13]	0,94	0,08	1,02
	3105 20	Mineral or chemical fertilisers containing the three fertilising elements nitrogen, phosphorus and potassium	1,23	0,11	1,35
	3105 30 00	Diammonium hydrogenorthophosphate (diammonium phosphate)	0,69	0,06	0,75

([12]) The default values are based on a weighted average of all other CBAM goods under CN 3102, with weighting according to the volumes of imports into the EU in 2019.

([13]) The default values are based on a weighted average of all other CBAM goods under CN 3105, with weighting according to the volumes of imports into the EU in 2019.

Aggregated goods category	CN code	Description	Default values (tonne CO_2e/tonne goods)		
			Direct emissions	Indirect emissions	Total emissions
	3105 40 00	Ammonium dihydrogenorthophosphate (monoammonium phosphate) and mixtures thereof with diammonium hydrogenorthophosphate (diammonium phosphate)	0,44	0,05	0,49
	3105 51 00	Other mineral or chemical fertilisers containing the two fertilising elements nitrogen and phosphorus (nitrates and phosphates)	1,29	0,11	1,4
	3105 59 00	Other mineral or chemical fertilisers containing the two fertilising elements nitrogen and phosphorus (other)	1,29	0,11	1,4
	3105 90	Other[13]	0,94	0,08	1,02

2.6 Default values for the transitional period for hydrogen

Aggregated goods category	CN code	Description	Default values (tonne CO_2e/tonne goods)		
			Direct emissions	Indirect emissions	Total emissions
Hydrogen	2804 10 00	Hydrogen	10,4	0,0	10,4

3 DEFAULT VALUES FOR DETERMINING INDIRECT EMISSIONS EMBEDDED IN CBAM GOODS OTHER THAN ELECTRICITY IN THE TRANSITIONAL CBAM PERIOD

The general approach for determining embedded indirect emissions in CBAM goods other than electricity is to use default values for the emission factor for electricity. Indirect emissions are then calculated by multiplying those default values with the amount of electricity consumed to produce the respective CBAM goods.

The default values represent the average emission factors of the country of origin electricity grid, based on data from the International Energy Agency (IEA).[14] These data are not published in this document but are made available to reporting declarants through the CBAM Transitional Registry.

The default values in the CBAM Transitional Registry represent the 5-year average emission factors for electricity covering the years 2016 to 2020. They are provided for around 150 countries. If a default value is not available for a specific country, the Registry attributes the world average emission factor as provided by the IEA. In the case of a few countries, the IEA dataset does not contain emission factors for the years 2016 to 2020, due to the high share of renewable electricity in the electricity grid. In the case of these few countries, the default values are set to zero.

If a reporting declarant does not want to use the default values made available by the Commission, there is also the possibility to use any other emission factor of the country of origin electricity grid based on publicly available data representing either the average emission factor or the CO_2 emission factor. Moreover, actual emission factors for electricity may be used in the case of a) a direct technical link between the installation in which the good is produced and the electricity generation source or b) a power purchase agreement between the consumer and the producer of the electricity for an amount of electricity that is equivalent to the amount for which the use of a specific value is claimed. Provisions on the use of emission factors other than those provided by the Commission can be found in Annex III, Section D.4 of Implementing Regulation (EU) 2023/1773.

The default values referred to in this section apply only until the end of the transitional period on 31 December 2025. From 2026 onwards, another set of default values will apply. Those values will be set as the average of:

- the emission factor of the Union electricity grid,
- the emission factor of the country of origin electricity grid, or
- the CO_2 emission factor of price-setting sources in the country of origin.

The default values for the determination of indirect emissions applicable from 2026 onwards will be determined through an implementing act planned for adoption in 2025.

([14]) International Energy Agency (IEA): Emission factors 2021.

4 DEFAULT VALUES FOR ELECTRICITY AS CBAM GOOD IN THE TRANSITIONAL CBAM PERIOD

The general approach for determining embedded direct emissions for electricity as CBAM good is to use default values for the CO_2 emission factors. CO_2 emission factor means the weighted average of the CO_2 intensity of electricity produced from fossil fuels within a geographic area. Embedded direct emissions are then calculated by multiplying those default values with the amount of electricity imported into the EU.

The default values represent the average emission factors of the electricity produced from fossil fuels in the country of origin, based on data from the International Energy Agency (IEA).[14] These data are not published in this document but are made available to reporting declarants through the CBAM Transitional Registry.

The default values in the CBAM Transitional Registry represent the 5-year average CO_2 emission factors covering the years 2016 to 2020. They are provided for around 15 countries, representing the countries from which electricity is currently exported to the EU or potentially in the near future.

Under certain conditions, other emission factors may be used, as specified in Annex III, Section D.2 of Implementing Regulation (EU) 2023/1773.

The default values referred to in this section apply only until the end of the transitional period on 31 December 2025. From 2026 onwards, another set of default values will apply. Those values will be set at the CO_2 emission factor in the third country, group of third countries or region within a third country, based on the best data available to the Commission. They will be determined through an implementing act planned for adoption in 2025.

5 GLOSSARY

Term	Definition
Actual emissions	emissions calculated based on primary data from the production processes of goods and from the production of electricity consumed during those processes
Aggregated goods category	a group of CBAM goods with their CN codes, used for the purpose of defining system boundaries of production processes
CO_2 emission factor	weighted average of the CO_2 intensity of electricity produced from fossil fuels within a geographic area. With respect to the geographic area, the default values for the CO_2 emission factors for electricity as CBAM good referred to in this document refer to countries.
Combined nomenclature (CN)	classification of goods, designed to meet the needs of: i) the Common customs tariff, setting import duties for products imported into the European Union (EU), as well as the Integrated tariff of the European Communities (Taric), incorporating all EU and trade measures applied to goods imported into and exported out of the EU; ii) the international trade statistics of the EU. The CN provides the means of collecting, exchanging and publishing data on EU international trade statistics. It is also used for the collection and publication of international trade statistics in intra-EU trade
Default value	value that is calculated or drawn from secondary data, which represents the embedded emissions in goods
Direct emissions	emissions from the production processes of goods including emissions from the production of heating and cooling that is consumed during the production processes, irrespective of the location of the production of the heating and cooling
Embedded emissions	direct emissions released during the production of goods and indirect emissions from the production of electricity that is consumed during the production processes
Emissions	release of greenhouse gases into the atmosphere from the production of goods
Emission factor for electricity	default value, expressed in CO_2e, representing the emission intensity of electricity consumed in production of goods
Goods	goods listed in Annex I to the CBAM Regulation (EU) 2023/956
Indirect emissions	emissions from the production of electricity, which is consumed during the production processes of goods, regardless of the location of the production of the consumed electricity
Installation	a stationary technical unit where a production process is carried out

Term	Definition
Operator	any person who operates or controls an installation in a third (i.e. non-EU) country
Reporting declarant	any of the following persons: (a) the importer who lodges a customs declaration for release for free circulation of goods in its own name and on its own behalf; (b) the person, holding an authorisation to lodge a customs declaration referred to in Article 182(1) of Regulation (EU) No 952/2013, who declares the importation of goods; (c) the indirect customs representative, where the customs declaration is lodged by the indirect customs representative appointed in accordance with Article 18 of Regulation (EU) No 952/2013, when the importer is established outside the Union or where the indirect customs representative has agreed to the reporting obligations in accordance with Article 32 of Regulation (EU) 2023/956
Specific embedded emissions	embedded emissions of one tonne of goods, expressed as tonnes of CO_2e emissions per tonne of goods
Tonne of CO_2e	one metric tonne of carbon dioxide (‘CO_2’), or an amount of any other greenhouse gas listed in Annex I to the CBAM Regulation with an equivalent global warming potential (‘CO_2e‘)
